Gradient boosting: raw scores somewhat over-confident; the fitted function makes them less extreme
(a) raw scores
(b) fitted calibration function
(c) after calibration
slope 0.76
slope 1.00
observed share of right-hand trials
calibrated probability
raw score (model output)
calibrated probability
1D CNN (final model): raw scores already close to calibrated; the fitted function changes them little
slope 0.94
slope 0.97
perfect calibration
raw: a group of trials with similar scores, 95 % CI
after calibration: the same groups, 95 % CI
function fitted for one left-out participant
